I am looking to build and develop a web app with the flexibility to (easily) transition everything to a mobile app at a later date.

Currently, our website is running on a WordPress theme. We have worked with React on other projects and familiar with how it works and prefer to use it with this as well. Our website can be found at FlyGuidesUSA.com

The web app will need to support 2 different types of User Profiles: One titled "Guides" and the other titled "Anglers

Guides:

- Guides will need the ability to sign up for a profile:
- Manage their calendar
    - Select which days they are available and what they want to charge for each type of trip
- List their skills/specialties
- Display Reviews and also respond to them
- Post pictures
- Post videos (Available for purchase)
- Keep a list of past clients & trips
- Set up a payment gateway integration (Stripe, Paypal, Square)

Anglers:

- Anglers will need the ability to view a map of where the Guides are located and also be able to search the Guides by city, guide availability dates, or skill/specialty.
- Create an extremely simple user profile
- Post pictures to a "shared photo gallery"
- Purchase credits to view videos posted by guides
- Ask questions to guides
- View guides pictures, reviews, skills, and specialties
- Book a trip with a guide
